## RESUMÉ OF CONDITIONS

---

Tree mortality caused by the mountain pine beetle increased from 998,157 trees in 1985 to 1,512,057 trees in 1986. Significant infestations occurred on the Ashley, Bridger-Teton, Boise, Caribou, Sawtooth, and Wasatch-Cache National Forests.

The spruce beetle continued to cause extensive mortality on the Payette National Forest, with approximately 12,600 infested trees detected. Smaller infestations are scattered throughout the Region.

Defoliation by the western spruce budworm increased from 2.9 million acres in 1985 to 3.1 million acres in 1986. Infestations increased in size and intensity on the Boise, Caribou, Dixie, Payette, Salmon, Sawtooth, and Wasatch-Cache National Forests. Infestations decreased on the Bridger-Teton, Challis, Fishlake, and Targhee National Forests.

Douglas-fir beetle activity increased in 1986 killing 6,237 trees. Tree mortality increased on the Boise, Caribou, Sawtooth, and Wasatch-Cache National Forests; and decreased on the Bridger-Teton National Forest.

Defoliation of lodgepole pine by the sugar pine tortrix decreased from 14,250 acres in 1985 to 1,500 acres in 1986 on the Bridger-Teton National Forest.

Pine engraver beetle activity increased in southern Idaho killing 2,402 trees.

Armillaria root disease surveys detected infection centers up to 600 feet in diameter in a spruce-fir stand on the Manti-LaSal National Forest in Utah.

Aspen defoliation by Marssonina blight and a variety of other pests was observed on the Targhee, Uinta, and Wasatch-Cache National Forests.

Dwarf mistletoe suppression projects removed infected overstory trees from 3,789 acres on 14 National Forests in the Region.

Pinyon blister rust, on single-leaf pinyon pine, was reported for the first time in Idaho.

Thyronectria canker on honeylocust was reported for the first time in Utah on an urban tree in Salt Lake City.

Adverse weather conditions caused damage in several areas. Hail defoliated a Douglas-fir stand in western Idaho. Heavy snow accumulation caused many avalanches in Utah resulting in extensive tree uprooting and breakage. In western Wyoming snow caused extensive leader deformity and breakage in a lodgepole pine plantation.

## ENTOMOLOGY

---

### BARK BEETLES

#### Mountain Pine Beetle, *Dendroctonus ponderosae* Hopkins

---

Tree mortality attributed to the mountain pine beetle increased from 998,157 trees killed in 1985 to 1,512,029 trees killed in 1986. The most devastating infestation continues to affect lodgepole and ponderosa pine stands on the Ashley and Wasatch-Cache National Forests in northeastern Utah. Tree mortality increased to 1,300,000 trees on the Ashley National Forest and 179,000 trees on the Wasatch-Cache National Forest. Mountain pine beetle activity was also detected on the Dixie, Manti-LaSal, and Uinta National Forests in Utah.

Mountain pine beetle activity remains static in southern Idaho with 18,000 lodgepole and ponderosa pines killed. Significant infestations are near Lost Basin and Trinity Creek on the Boise National Forest; in Caribou Basin on the Caribou National Forest; along Squaw Creek on the Challis National Forest; and in the Big Wood River Drainage and Sawtooth Valley on the Sawtooth National Forest. Some beetle activity was observed on the Payette, Salmon, and Targhee National Forests.

Mortality figures from the aerial detection surveys are displayed in Table 1. The status of infestations by State is displayed in Table 2. The location of the major infestations in the Region are shown in Figure 1.

#### Spruce Beetle, *Dendroctonus rufipennis* (Kirby)

---

Aerial and ground surveys detected 900 mortality centers with 14,000 fading spruce trees on the Payette and Boise National Forests in southern Idaho. Mortality was scattered on the McCall, New Meadows, and Council Ranger Districts of the Payette National Forest and on the Cascade Ranger District of the Boise National Forest.

Spruce beetle mortality was scattered throughout the spruce type in Utah with 210 trees killed within 30 mortality centers. On the Wasatch-Cache National Forest, heavy spring snows caused avalanches that uprooted Engelmann spruce causing a rapid increase in beetle populations.

Aggressive salvage and trap tree programs have minimized tree losses in accessible areas, while in remote areas infestations remain untreated.

Mortality figures from aerial detection surveys are displayed in Table 1.

#### Douglas-Fir Beetle, *Dendroctonus pseudotsugae* Hopkins

---

Tree mortality caused by the Douglas-fir beetle increased five-fold to 5,114 trees throughout southern Idaho. Beetle activity increased on all Forests except the Challis and Targhee National Forests. Activity was concentrated in the Shafer Butte area on the Boise National Forest, along McCoy Creek on the Caribou National Forest, throughout the Monroe Butte-Sturgill Peak area on the Payette National Forest and in the South Fork of the Boise River Drainage on the Sawtooth National Forest.

In Utah, Douglas-fir beetle continues to kill trees weakened from defoliation by western spruce budworm in Logan Canyon on the Wasatch-Cache National Forest. In western Wyoming, on the Bridger-Teton National Forest, beetle activity decreased from 4,500 trees killed in 1985 to 746 trees killed in 1986. Infestations persist in the Greys River, Hoback, and Buffalo Fork drainages. Mortality figures from aerial detection surveys are found in Table 1.

### **Pine Engraver Beetle, *Ips pini* (Say)**

---

Pine engraver beetle activity increased significantly in southern Idaho with 2,400 ponderosa pines killed. Activity was observed in Boise Basin, Buck Canyon, and Trinity Creek on the Boise National Forest, along Calf Pen Creek and Lick Creek on the Payette National Forest, in the Granite Creek drainage on the Salmon National Forest, and near Featherville on the Sawtooth National Forest. Mortality figures from aerial detection surveys are found in Table 1.

### **Western Pine Beetle, *Dendroctonus brevicomis* LeConte**

---

Western pine beetle and pine engraver beetle were observed in pole-size and larger ponderosa pine in the Boise Basin area near Idaho City, Idaho.

### **Jeffrey Pine Beetle, *Dendroctonus jeffreyi* Hopkins**

---

Infestations of Jeffrey pine beetle caused mortality of Jeffrey pines on the Toiyabe National Forest in Nevada.

This map illustrates the distribution of National Forests within the Intermountain Region, covering parts of Idaho, Nevada, Utah, and Wyoming. A north arrow and a scale bar (0 to 40 miles) are provided for orientation and measurement. The map labels numerous National Forests, including Payette, Salmon, Challis, Boise, Snake, Caribou, Targhee, Teton, Bridger, Snake, and Caribou in Idaho; Humboldt, Toiyabe, and National in Nevada; and Manti-Lasal, Fishlake, and others in Utah. The title 'NATIONAL FORESTS OF THE INTERMOUNTAIN REGION' is prominently displayed at the bottom right.

FIGURE 2. Areas infested by spruce beetle on Payette National Forest during 1986 as observed during aerial detection surveys.

## DEFOLIATORS

### **Western Spruce Budworm, *Choristoneura occidentalis* Freeman**

---

Conifer defoliation by western spruce budworm increased to 3.1 million acres in 1986, an increase of 230,000 acres from 1985. Defoliation continues to expand on the Boise, Payette, Caribou, Salmon, and Sawtooth National Forests in southern Idaho, and on the Dixie and Wasatch-Cache National Forests in Utah. Defoliation decreased on the Challis and Targhee National Forests in southern Idaho, and on the Fishlake National Forest in Utah and Bridger-Teton National Forest in western Wyoming.

The acres infested by National Forest are displayed in Table 3. The status of the infestations by State is shown in Table 4. Locations of major infestations in the Region are depicted in Figure 3.

### **Sugar Pine Tortrix, *Choristoneura lambertiana* (Busck); and Pine Needle Sheathminer, *Zelleria haimbachi* Busck**

---

Isolated infestations continue in lodgepole pine on the Targhee National Forest in eastern Idaho, and the Bridger-Teton National Forest in western Wyoming.

### **Douglas-Fir Tussock Moth, *Orgyia pseudotsugata* (McDunnough)**

---

No defoliation was observed in southern Idaho during aerial detection surveys.

Pheromone baited detection traps were placed in the Boise, Payette, and Sawtooth National Forests, State of Idaho and Bureau of Land Management lands near Bellevue, Idaho, and in the Owhyee Mountains of southwestern Idaho. Survey results indicate increasing populations on the Payette National Forest and in the Owhyee Mountains.

### **Gypsy Moth, *Lymantria dispar* (L.)**

---

No gypsy moths were found during detection surveys using pheromone baited traps. Fifty-one developed sites were monitored in southern Idaho in cooperation with the Idaho Department of Agriculture and the Idaho Department of Lands.

## MISCELLANEOUS INSECTS

### **Locust borer, *Megacyllene robiniae* (Forster)**

---

The locust borer continues to kill black locust that line ditch banks and canals in Boise, Idaho. The borer killed 450 trees in 1986 of a total 1,800 city-owned black locust.

### **Scarab Beetle, *Dichelonyx ?backi*?**

---

Scattered defoliation on new growth caused by a scarab beetle, identified as *Dichelonyx backi*, was observed in lodgepole pine on the Targhee National Forest. Defoliation was most evident on young stands but feeding was also detected on mature trees.

### **Spruce Bud Scale, *Physokermes piceae* (Schrank)**

---

Infestations of spruce bud scale were detected on ornamental spruce, especially Norway spruce, in southern Idaho.

**TABLE 3. Acres of defoliation by western spruce budworm in the Intermountain Region during 1985-1986 as observed during aerial detection surveys.**

Forest (& Adjacent Land)*	Year	Defoliation Intensity				Change (From 1985)

**FIGURE 3. Areas infested by western spruce budworm in Region 4 during 1986 as observed during aerial detection surveys.**

**Intermountain Region—Status of insects in southern Idaho, Nevada, Utah, and western Wyoming.**

<b>Insect</b>	<b>Host</b>	<b>Location</b>	<b>Remarks</b>
Douglas-fir beetle <i>Dendroctonus pseudotsugae</i>	Douglas-fir	Idaho, Utah, Wyoming	Activity increased in 1986; 6,237 trees were killed. Group killing of Douglas-fir increased on the Boise, Caribou, and Sawtooth National Forests, ID; and on the Wasatch-Cache National Forest, UT. Mortality decreased on the Bridger-Teton National Forest, WY.
Douglas-fir tussock moth <i>Orgyia pseudotsugata</i>	Douglas-fir	Idaho	No new defoliation was observed.
Gypsy moth <i>Lymantria dispar</i>	—	Idaho	Populations were not detected by pheromone trapping in 1986.
Jeffrey pine beetle <i>Dendroctonus jeffreyi</i>	Jeffrey pine	Nevada	Minimal beetle activity was detected on the Toiyabe National Forest, NV.
Larch casebearer <i>Coleophora laricella</i>	Western larch	Idaho	Some defoliation was observed on the Payette National Forest.
Locust borer <i>Megacyllene robiniae</i>	Black locust	Idaho	Locust borer killed 450 black locust in Boise, ID.
Mountain pine beetle <i>Dendroctonus ponderosae</i>	Lodgepole pine, ponderosa pine, other pines	Idaho, Utah, Wyoming	Mountain pine beetle activity increased in the Region. Tree mortality increased from 998,157 trees in 1985 to over 1.5 million trees in 1986. Significant infestations occurred on the Boise, Caribou, and Sawtooth National Forests, ID; the Ashley and Wasatch-Cache National Forests, UT; and the Bridger-Teton National Forest, WY.
Pine butterfly <i>Neophasia menapia</i>	Ponderosa pine	Idaho	Adult moths were observed in ponderosa pine stands.
Pine engraver <i>Ips pini</i>	Pines	Idaho	A significant increase in activity was observed in southern Idaho where 2,400 trees were killed on the Boise, Payette, Salmon and Sawtooth National Forests.

**Intermountain Region—Status of insects in southern Idaho, Nevada, Utah, and western Wyoming—Continued.**

Insect	Host	Location	Remarks
Pine needle sheathminer <i>Zelleria haimbachi</i>	Lodgepole pine	Idaho	Defoliation by this insect and the sugar pine tortrix, was detected on the Targhee National Forest, ID.
Scarab beetle <i>Dichelonyx ?backi?</i>	Lodgepole pine	Idaho	Scattered defoliation on new growth in lodgepole stands was detected on the Targhee National Forest, ID.
Spruce beetle <i>Dendroctonus rufipennis</i>	Engelmann spruce	Idaho, Utah, Wyoming	Epidemic populations continue to cause significant mortality on the Payette National Forest, Idaho where 12,600 infested trees were detected in 1986. Smaller infestations are on the Boise National Forest, ID; the Bridger-Teton National Forest, WY; and the Uinta National Forest, UT.
Spruce bud scale <i>Physokermes piceae</i>	Spruces	Idaho	Infestations of spruce bud scale were detected on ornamental spruce scattered throughout southern Idaho.
Sugar pine tortrix <i>Choristoneura lambertiana</i>	Pines	Idaho, Wyoming	This insect continues to cause scattered defoliation of lodgepole and ponderosa pines.
Western pine beetle <i>Dendroctonus brevicornis</i>	Ponderosa pine	Idaho	Tree mortality caused by a complex of bark beetles including the western pine beetle was detected on the Boise National Forest, ID.
Western pineshoot borer <i>Eucosma sonomana</i>	Ponderosa pine	Idaho	Scattered infestations were observed.
Western spruce budworm <i>Choristoneura occidentalis</i>	Douglas-fir, spruce, true firs western larch	Idaho, Utah, Wyoming	Conifers on about 3.1 million acres were defoliated in 1986, compared to 2.9 million acres in 1985. Infestations expanded on the Boise, Caribou, Payette, Salmon and Sawtooth National Forests, ID; and on the Dixie and Wasatch-Cache National Forests, UT. Defoliation decreased on the Bridger-Teton, Challis, Fishlake and Targhee National Forests.

## PATHOLOGY

### STEM AND BRANCH DISEASES

#### Dwarf Mistletoes, *Arceuthobium* spp.

Dwarf mistletoe management considerations are incorporated into long-range plans and silvicultural prescriptions for timber management. Concurrently, dwarf mistletoe suppression projects are funded by Forest Pest Management to "clean up" a diminishing acreage of previously harvested stands in which infected trees were not removed and now overtop established regeneration. The goal of the Regional program is to implement suppression strategies as part of ongoing forest management activities; gradually decreasing reliance on the suppression funding program.

The dwarf mistletoe management program in Region 4 is a sequential process of education, detection and evaluation, pre-suppression survey, suppression and post-suppression evaluation. Accomplishments for 1986 are reported in Table 5.

TABLE 5. Dwarf mistletoe accomplishments - Region 4, 1986.

National Forest	Pre-suppression Survey Acres	Suppression Project Acres	Post-Suppression Evaluation Acres
Ashley	0	280	0
Boise	44,872	509	300
Bridger-Teton	2,500	200	300
Caribou	12,000	210	250
Challis	1,667	32	58
Dixie	0	500	0
Fishlake	1,000	30	0
Manti-LaSal	60	45	30
Payette	20,204	254	641
Salmon	13,783	133	0
Sawtooth	77	78	78
Targhee	753	1,293	430
Toiyabe	0	25	0
Wasatch-Cache	200	200	0
TOTAL	97,116	3,789	2,087

Douglas-fir dwarf mistletoe was reported for the first time in the Owyhee Mountains, one mile north of Silver City in southwestern Idaho.

#### Pinyon Blister Rust, *Cronartium occidentale* Hedgc., Bethel & Hunt

This blister rust causes a stem canker and was reported for the first time on pinyon pine in Idaho in the Albion Mountains north of the Idaho/Utah border.

### ***Thyronectria* Canker, *Thyronectria* sp.**

---

The first case of this canker disease of honeylocust in the state of Utah was detected in Salt Lake City by Dr. Sherman V. Thomson of the Utah State University Extension Service. This fungus kills urban honeylocust trees along the Front Range of Colorado.

## **ROOT DISEASES**

### **Annosus Root Disease, *Heterobasidion annosum* (Fr.) Bref.**

---

This fungus becomes established in new areas by invading freshly exposed wounds and stumps. Seedling, sapling, and pole-size pines are killed by the fungus. Douglas-fir seedlings and saplings are occasionally killed. The fungus causes a root and butt rot of true firs and spruce and occasional mortality.

### **Armillaria Root Disease, *Armillaria obscura* ( Secr.) Herink**

---

A study was initiated in cooperation with the Intermountain Forest and Range Experiment Station to determine the species of *Armillaria* on conifers in Utah. Diploid isolates, previously identified as *A. mellea*, were paired with haploid isolates of known *Armillaria* spp. to determine correct taxonomic position. Preliminary results indicate that *Armillaria obscura*, a pathogenic species of *Armillaria*, occurs on living and mountain pine beetle-killed lodgepole pines on the Wasatch-Cache National Forest, living Engelmann spruce and dead subalpine fir on the Manti-LaSal National Forest, and stumps of Engelmann spruce harvested 20 years previously on the Dixie National Forest.

A ground survey of a spruce-fir stand on the Manti-LaSal National Forest revealed extensive infection by *A. obscura*. Thirty-six percent of the area was found to be infested with the fungus. The pattern of infection varied from scattered individual trees to large infection centers up to 600 feet in diameter. Many of the dead and downed trees also showed signs of infestation by spruce beetle, *Dendroctonus rufipennis*.

### **Black Stain Root Disease, *Verticicladiella wagneri* Kend.**

---

A dark-brown to black-colored sapwood stain caused by *Verticicladiella wagneri* was found on roots and butts of dead and dying pinyon pine near Almo, Idaho. Mortality often occurred in expanding disease centers. The extent of the infection centers is being determined through use of color-infrared, low level photography.

### **Tomentosus Root Disease, *Inonotus tomentosus* (Fr.) Gilbn.**

---

The fungus is frequently detected as a root/butt rot of pole-size and larger Douglas-fir in southern Idaho. It is occasionally detected on Engelmann spruce and subalpine fir. Infection seldom causes direct mortality, except when the fungus kills suppressed Douglas-fir seedlings. Infection predisposes trees to windthrow and bark beetle attack.

In Utah, the fungus causes a root/butt rot of mature Engelmann spruce on the Manti-LaSal National Forest, and lodgepole pine on the Wasatch-Cache National Forest. Infection often results in mortality of Engelmann and blue spruce on the Aquarius Plateau, Dixie National Forest.

### **Schweinitzii Butt Rot, *Phaeolus schweinitzii* (Fr.) Pat.**

---

Douglas-fir in southern Idaho can be infected by the red-brown butt rot fungus. The fungus is associated with other root pathogens, primarily *Inonotus tomentosus*. Infection can kill Douglas-fir seedlings, but usually predisposes the tree to windthrow or bark beetle attack.

## **FOLIAGE DISEASES**

### **Douglas-fir Needle Cast, *Rhabdocline* sp.**

---

Douglas-fir needle cast can be difficult to detect because infections often occur in Douglas-fir stands that are defoliated by the western spruce budworm. The combined defoliating effects of the pests cause mortality of seedling and sapling-sized trees in north-central and eastern Idaho.

### **Marssonina blight, *Marssonina populi* (Lib.) Magn.**

---

The disease infects aspen foliage throughout the host range in southern Idaho and northern Utah.

## **VASCULAR WILTS**

### **Dutch Elm Disease, *Ceratocystis ulmi* (Buism.) C. Mor.**

---

The city of Boise, Idaho has a street-tree population of about 2,100 elm trees. In 1986, 30 trees were killed by dutch elm disease. The city plans to replace the elms with trees requiring less maintenance. In Utah, the disease was found for the first time in the city of Logan. Mortality of American elms continues in communities along the Wasatch Front in Utah.

## **ABIOTIC**

### **Hail Damage**

---

A severe, spring hailstorm stripped the foliage and buds from the southeast side of a 200-acre Douglas-fir stand in the Brownlee Creek drainage, 15 miles northwest of Cambridge, ID.

### **Snow Damage**

---

A wet and heavy snowfall in February 1986 caused extensive tree damage throughout western Wyoming and northern Utah. Large avalanches uprooted and broke mature and over-mature Engelmann spruce, subalpine fir, and Douglas-fir on the Wasatch-Cache and Uinta National Forests. Leaders were bent and broken on many 4 to 6 foot tall lodgepole pine on the Bridger-Teton National Forest.

**Intermountain Region—Status of diseases in southern Idaho, Nevada, Utah, and western Wyoming**

Disease	Host	Location	Remarks
<b>STEM AND BRANCH DISEASES</b>			
Aspen trunk rot <i>Phellinus tremulae</i>	Aspen	Idaho, Nevada, Utah, Wyoming	Decay occurs in most aspen stands in the Region.
Comandra blister rust <i>Cronartium comandrae</i>	Lodgepole pine, ponderosa pine	Idaho, Utah, Wyoming	Infections occur infrequently on lodgepole pine. Infections on ponderosa pine are found infrequently and only on planted stock in southern Idaho.
Dwarf mistletoes <i>Arceuthobium</i> spp.	Douglas-fir, lodgepole pine, ponderosa pine, western larch	Idaho, Nevada, Utah, Wyoming	These continue to be the most frequently observed pests in the Region. Suppression projects removed infected overstory trees from 3,789 acres.
Pinyon blister rust <i>Cronartium occidentale</i>	Singleleaf pinyon	Idaho, Nevada	Blister rust of pinyon was reported for the first time in the Albion Mtns., ID, six miles north of the Utah border.
Red ring rot <i>Phellinus pini</i>	Western larch, Douglas-fir, true firs, pines, spruce	Idaho, Utah, Wyoming	This fungus occurs in stands of mature conifers. Infection intensity is varied.
Rust-red stringy rot <i>Echinodontium tinctorium</i>	Grand fir, white fir, subalpine fir	Idaho, Nevada	Decay caused by this fungus is common in mature and overmature true firs.
Stalactiform blister rust <i>Cronartium coleosporioides</i>	Lodgepole pine	Idaho, Utah Wyoming	This rust occurs in localized areas of host type across the Region. Heavy infection levels occur in several areas.
Thyronectria canker <i>Thyronectria</i> sp	Honeylocust	Utah	This fungus was found for the first time on honeylocust in Salt Lake City by the Utah State University Extension Service.
Western gall rust <i>Endocronartium harknessii</i>	Lodgepole pine, ponderosa pine	Idaho, Utah, Wyoming	Gall rust occurs throughout host types. Infestation levels vary by site.

**Intermountain Region—Status of diseases in southern Idaho, Nevada, Utah, and western Wyoming—Continued**

Disease	Host	Location	Remarks
<b>ROOT DISEASES</b>			
Annosus root disease <i>Heterobasidion annosum</i>	Douglas-fir, lodgepole pine, ponderosa pine, true firs	Idaho, Nevada, Utah, Wyoming	This fungus occurs as a root and butt rot of true firs. It can kill young ponderosa pine, and can predispose lodgepole pine and Douglas-fir to windthrow and bark beetle attack.
Armillaria root disease <i>Armillaria</i> spp.	Douglas-fir, grand fir, pines, spruce	Idaho, Utah, Wyoming	In southern Idaho, <i>Armillaria</i> functions as a weak pathogen. In Utah, <i>Armillaria obscura</i> was identified on lodgepole pine, Engelmann spruce, and subalpine fir.
Black stain root disease <i>Verticicladiella wagneri</i>	Pinyon pine	Idaho, Nevada, Utah	Pinyon pine mortality caused by black stain root disease is occurring in progressively expanding disease centers near Almo, ID.
Schweinitzii butt rot <i>Phaeolus schweinitzii</i>	Douglas-fir, ponderosa pine	Idaho	Decay is common in mature and overmature forests, especially those with a recent fire or logging history. The fungus is often found associated with other root diseases and bark beetles.
Tomentosus root disease <i>Inonotus tomentosus</i>	Douglas-fir, spruce, subalpine fir, lodgepole pine	Idaho, Utah	The fungus is commonly found with <i>P. schweinitzii</i> as a root/butt rot of pole-size and larger Douglas-fir and spruce less often in subalpine fir in Idaho. Infection can cause tree mortality. In Utah, this disease was detected on Engelmann spruce on the Manti-LaSal National Forest, and on lodgepole pine on the Wasatch-Cache National Forest.
<b>FOLIAGE DISEASES</b>			
Douglas-fir needlecast <i>Rhabdocline</i> spp.	Douglas-fir	Idaho	Infection, in conjunction with western spruce budworm feeding, continues to cause defoliation and mortality of all size-classes of the host in central and eastern Idaho.

**Intermountain Region—Status of diseases in southern Idaho, Nevada, Utah, and western Wyoming—Continued**

Disease	Host	Location	Remarks
Elytroderma disease <i>Elytroderma deformans</i>	Ponderosa pine	Idaho	High levels of infection continue throughout the host type, especially in stands around Cascade, ID.
Fir broom rust <i>Melampsorella caryophyllacearum</i>	Subalpine fir	Idaho, Utah, Wyoming	Infection is scattered in the host type. High incidence and infection levels have historically been observed.
Fir needle cast <i>Lirula</i> spp.	Subalpine fir, grand fir	Idaho	Infected stands were found on the Council and Weiser Ranger Districts of the Payette National Forest.
Larch needle cast <i>Meria laricis</i>	Western larch	Idaho	Incidence and severity of infection was at a low level.
Marssonina blight <i>Marssonina populi</i>	Aspen	Idaho, Utah, Wyoming	Scattered incidence of light-to-moderate intensity was observed for the Region.
Spruce broom rust <i>Chrysomyxa arctostaphyli</i>	Engelmann spruce	Idaho, Utah, Wyoming	Infection occurs scattered in the Region. It is common in the drainages west of Bear Lake in eastern Idaho.

**VASCULAR WILTS**

Dutch elm disease <i>Ceratocystis ulmi</i>	<i>Ulmus</i> spp.	Idaho, Utah	Thirty trees were infected from a population of 2,100 elms surveyed along the city streets in Boise, ID. In Logan, Utah this disease was found for the first time. Mortality of native elms continued throughout Utah, however, losses are not great due to the small host population.
---	-------------------	-------------	--

**ABIOTIC**

Hail damage	Douglas-fir	Idaho	Hail from an early spring storm stripped the foliage from a 200-acre Douglas-fir stand 15 miles northwest of Cambridge, ID.
Snow damage	Engelmann spruce, subalpine fir, lodgepole pine	Utah, Wyoming	Abnormally wet and heavy snowfall in Utah led to avalanches that caused uprooting and breakage of spruce and fir and bending of lodgepole pine terminals in Wyoming.
